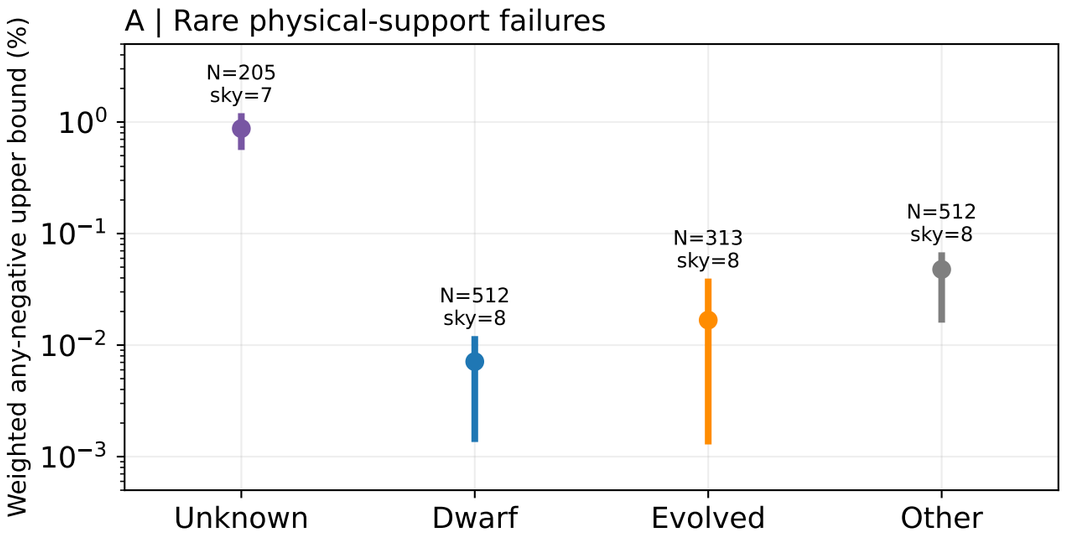
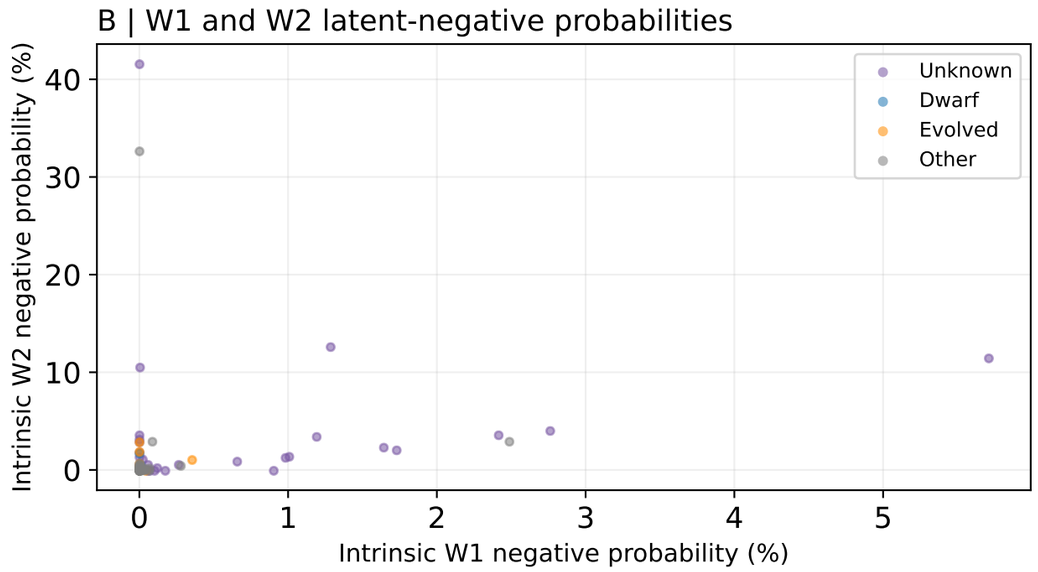
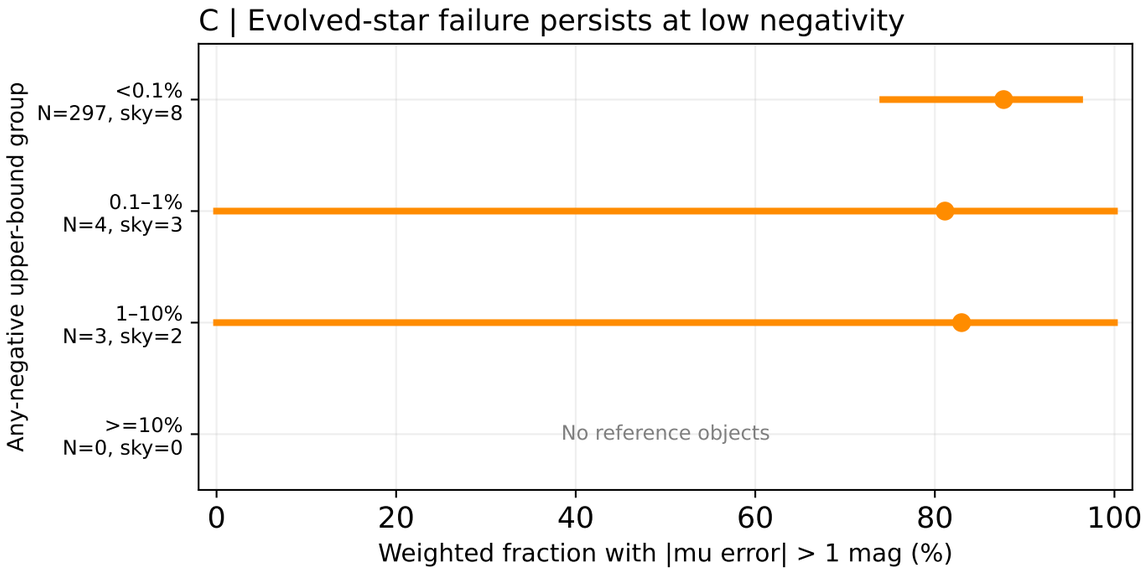
Latent-flux support and measurement failure: same-object development audit

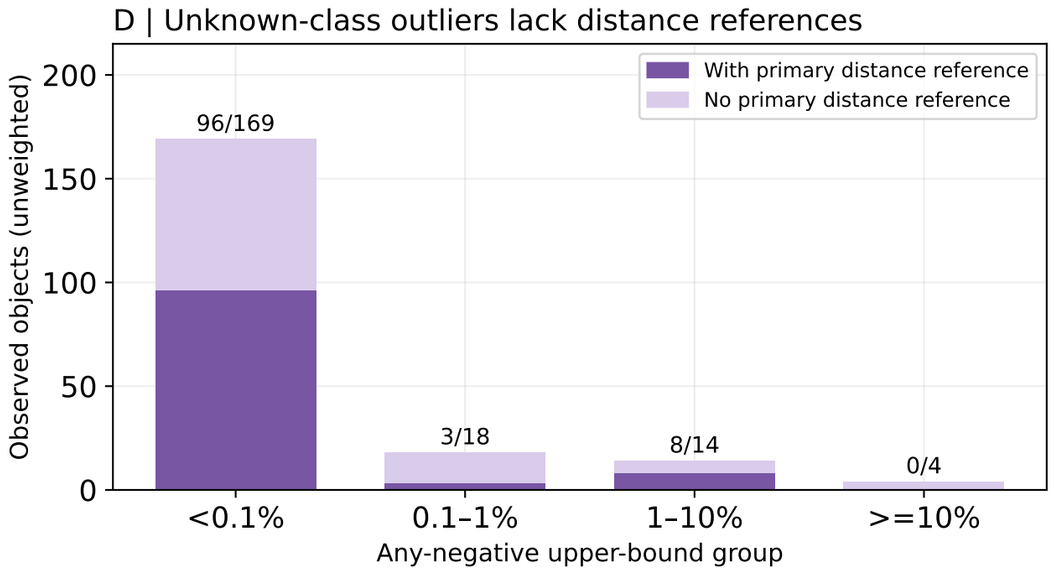
1,542 native DR11 PSF objects | response12 | fixed reference prior | exploratory sky-block intervals

A and C retain design weights. B shows individual probabilities. D shows raw evidence denominators.









Negative observed flux is legal; these probabilities concern the latent intrinsic-flux model.

Associations do not establish cause. Low-negativity evolved stars still have severe reference disagreement.

No new validation outcomes or physical population contamination measurements are shown.
