Class-distance recovery: nonzero-truth coverage with all failures retained

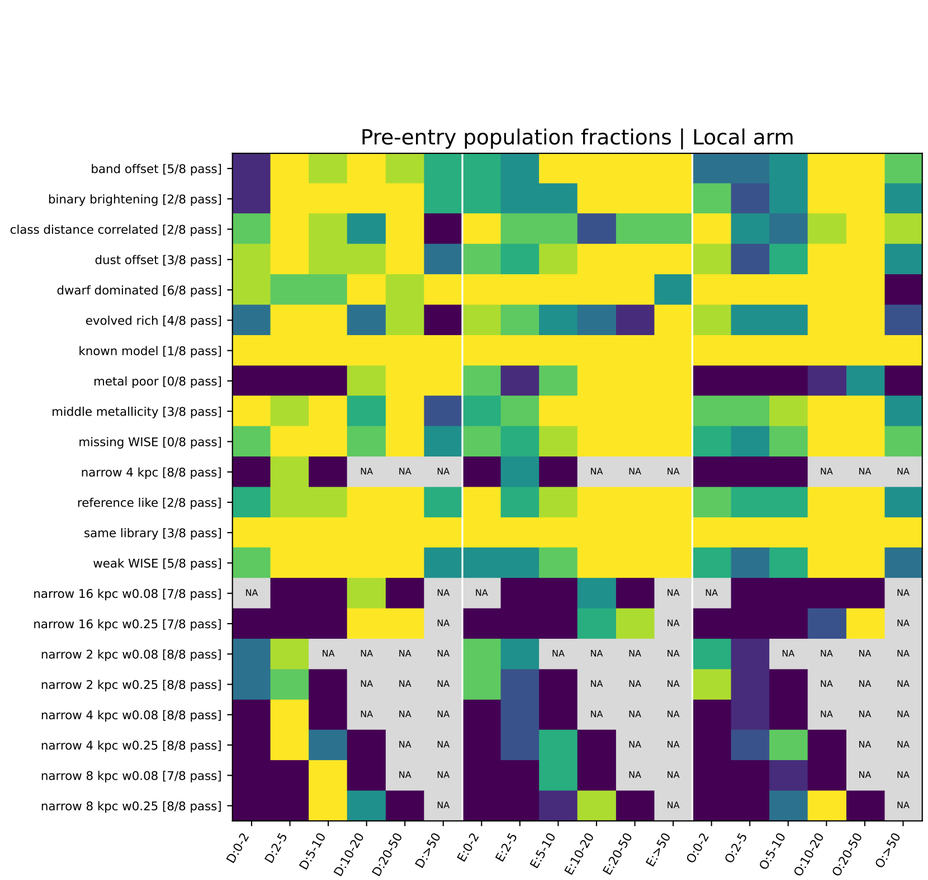

D = dwarf; E = evolved; O = other | distances in kpc; scenario widths in mag | row brackets show numerical passes

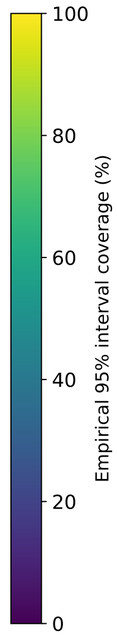

Each cell uses only catalogs with positive truth in that cell. n1-n7 mark smaller denominators; gray NA means no positive truth.

All 176 catalogs remain in the design. Coverage including structural zeros and accepted-only results are separately preserved in source tables.

Eight conditional realizations share source libraries. These are descriptive simulation frequencies, not independent real calibration or 18 independent bin trials.
