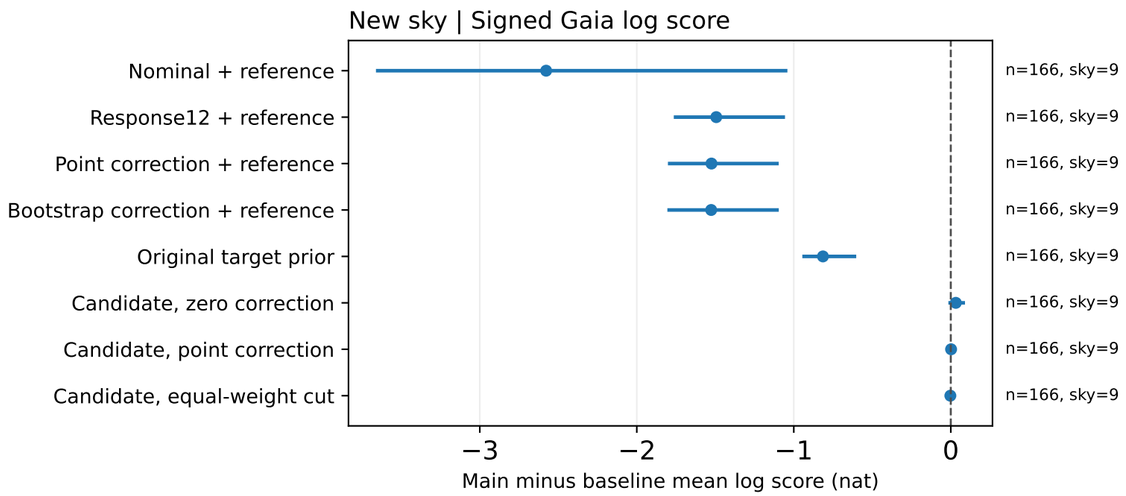
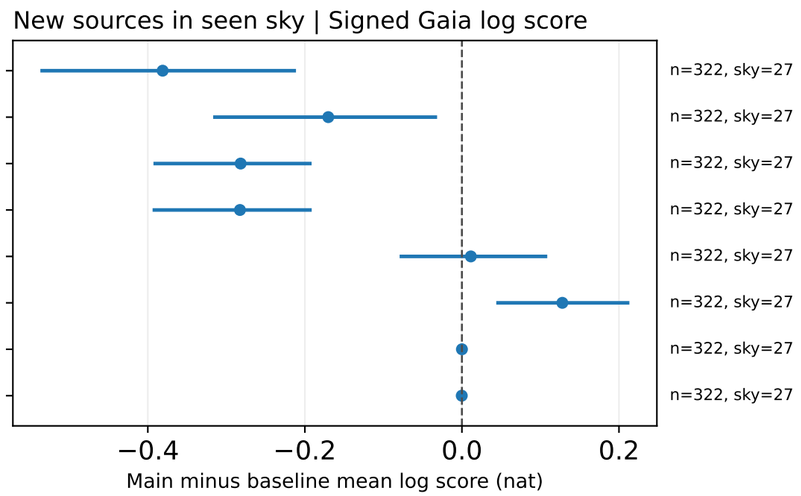
Product-matched external field comparisons

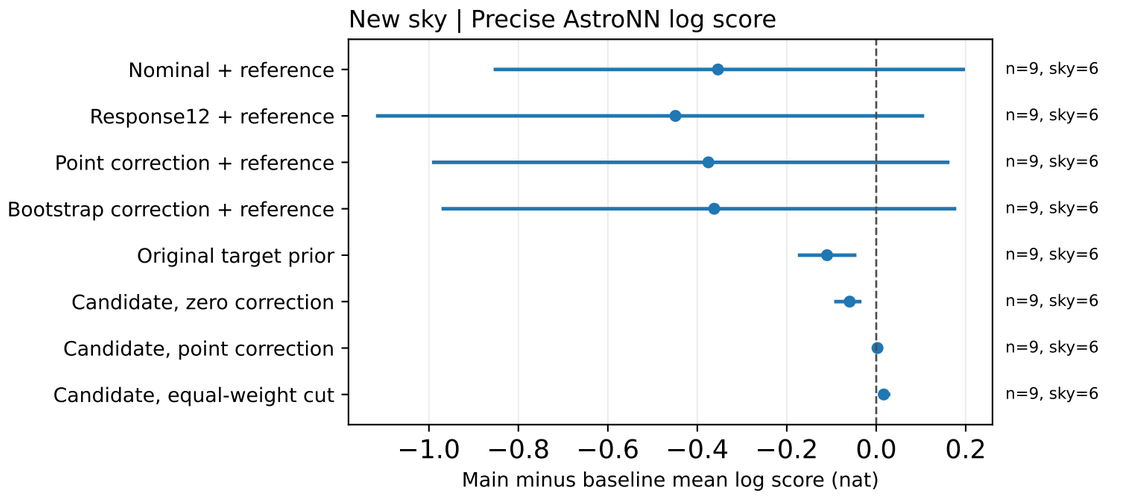
Primary candidate-admission subset | all objects retained, including inherited numerical failures

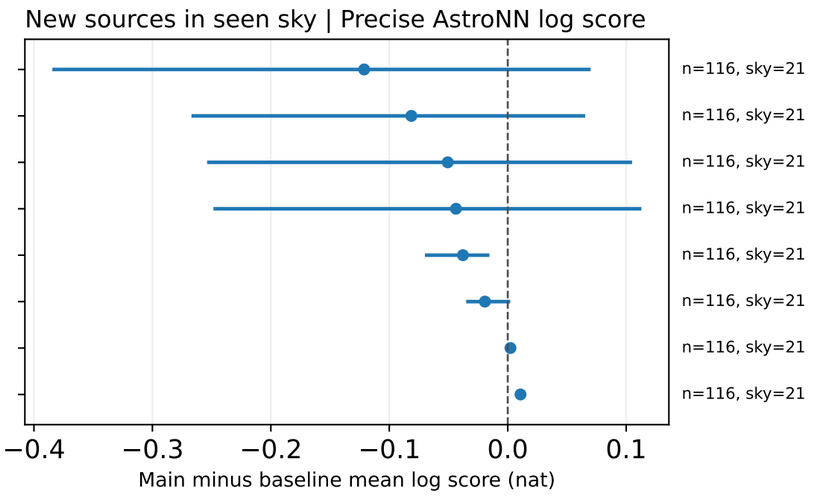
Main candidate = response12 / calibration12 + evidence-weighted luminosity corrections + candidate population prior

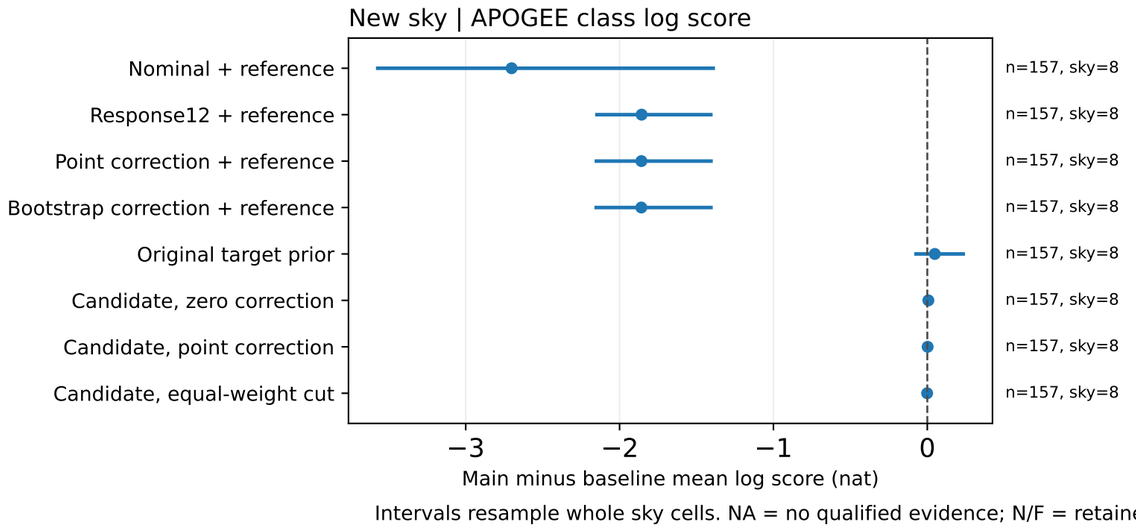
Positive score differences favor the main candidate. Its inherited ensemble evidence gate remains failed.

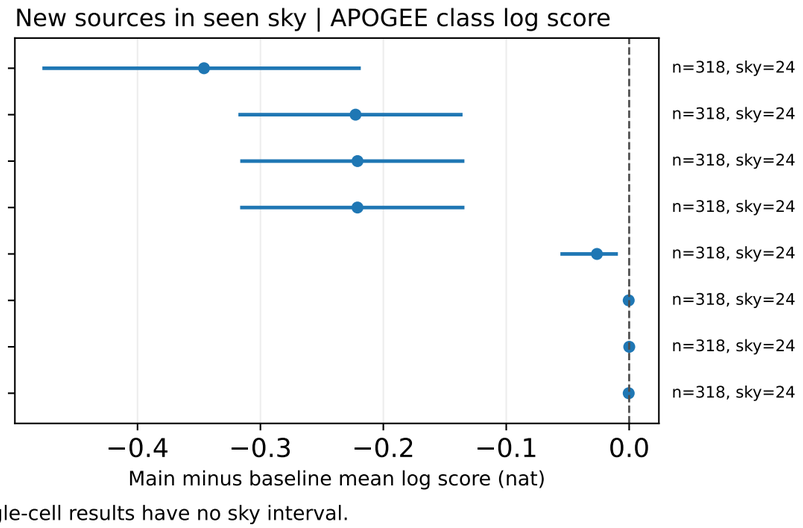












Intervals resample whole sky cells. NA = no qualified evidence; N/F = retained nonfinite score. Single-cell results have no sky interval.

AstroNN has Gaia ancestry; reference channels are not independent absolute-distance truths. New-source seen-sky evidence is not new-sky validation.

Sparse qualified samples do not validate empty distance, metallicity or photometric domains; source and numerical denominators remain in the tables.
