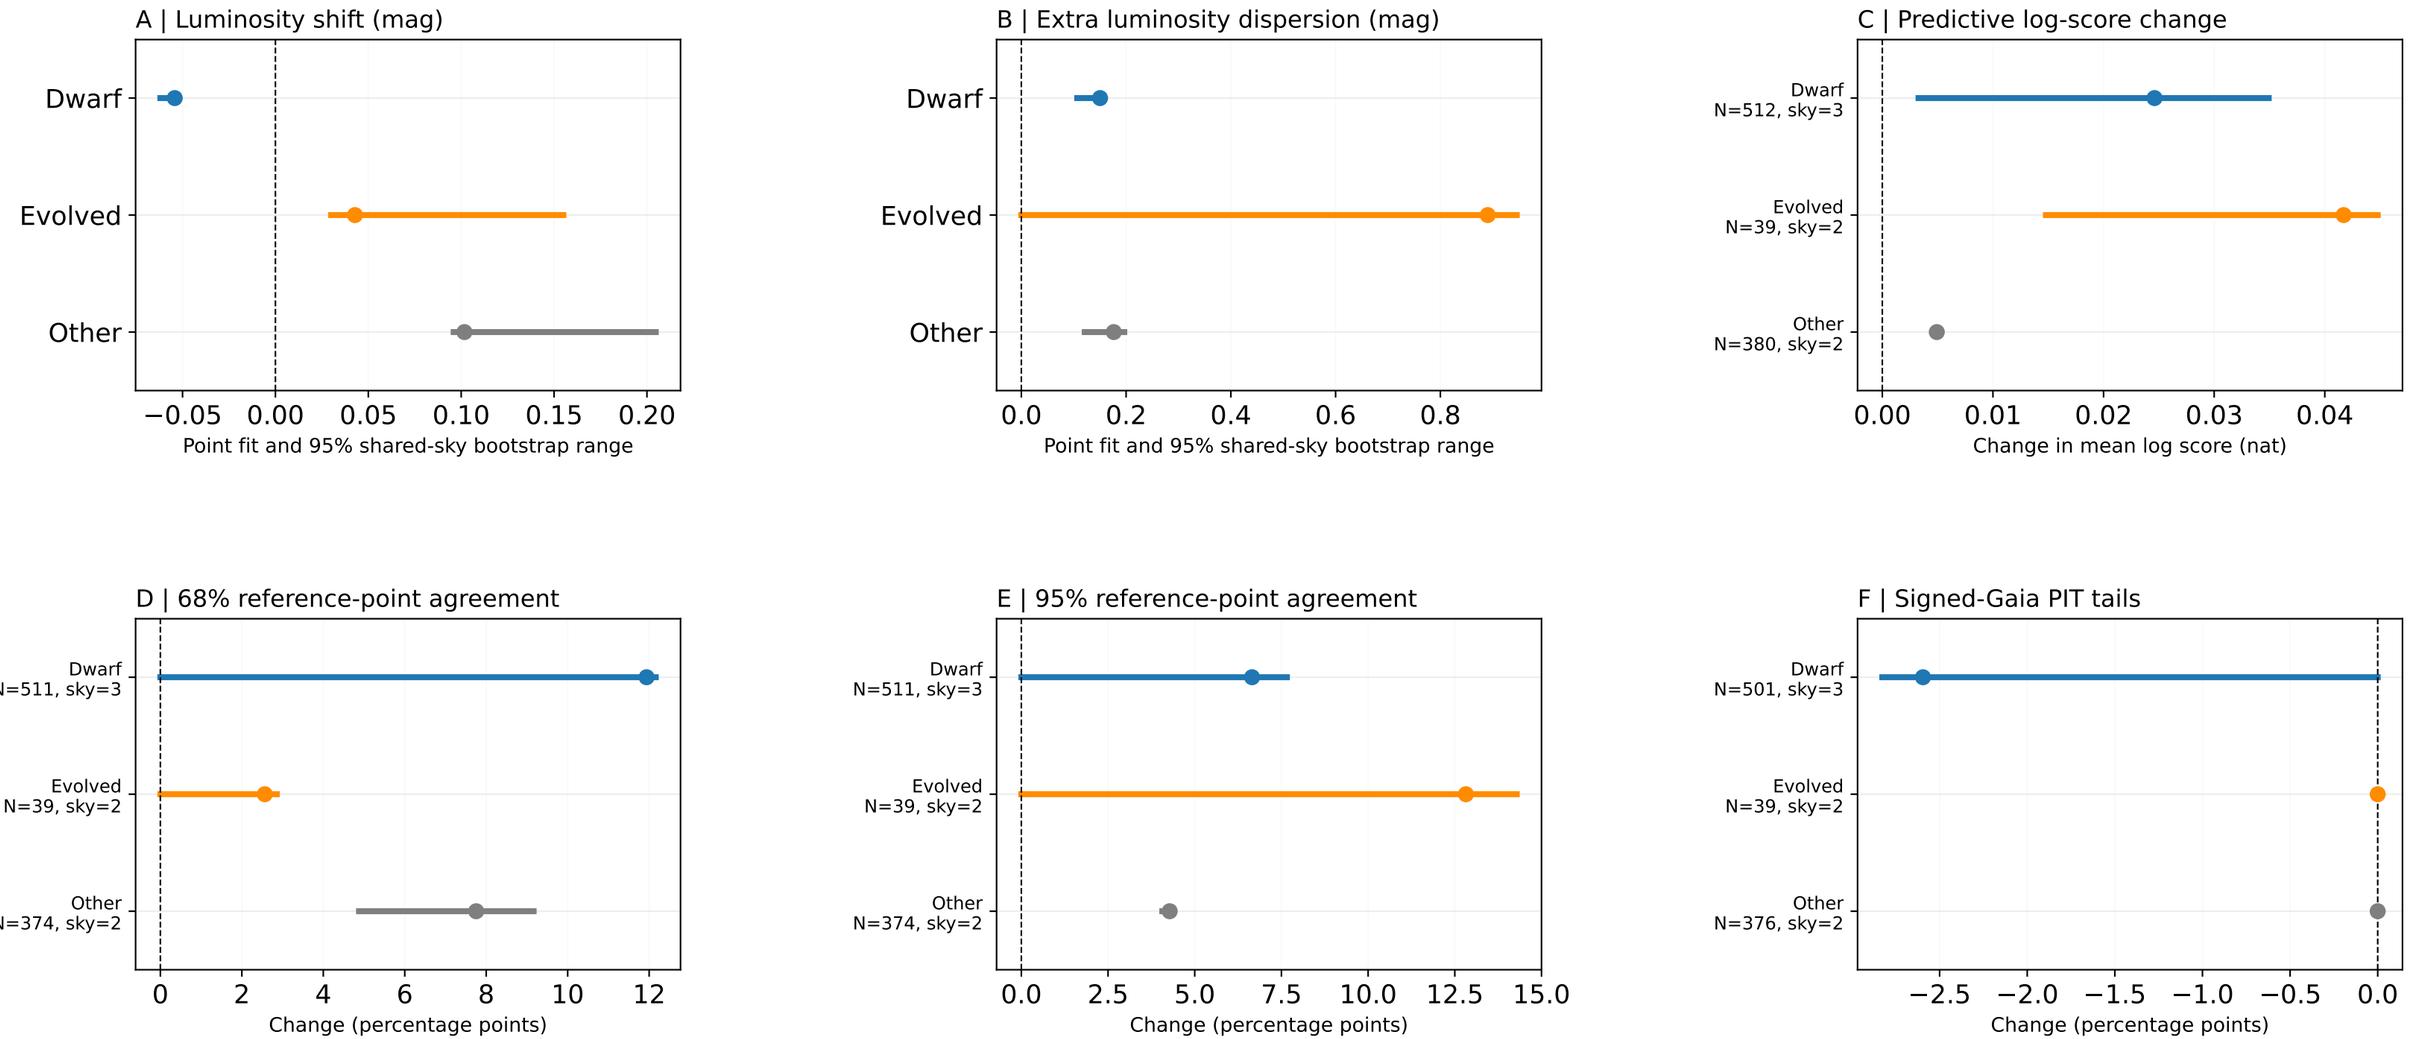
Constrained luminosity correction: calibration fit and held-out sky guards

Native DR11 PSF | reference prior | response12 | 32 shared calibration bootstrap draws

Evolved correction: only 3 fitting sky blocks; held-out guard: 39 stars in 2 sky blocks



C–E: positive is better. F: negative is better. Guard intervals use the available sky blocks.

Reference-point agreement is not true coverage. Sparse sky/source ancestry limits independent calibration claims.

All 15 bootstrap guards and 96 numerical checks passed; final target-prior and external validation remain pending.
