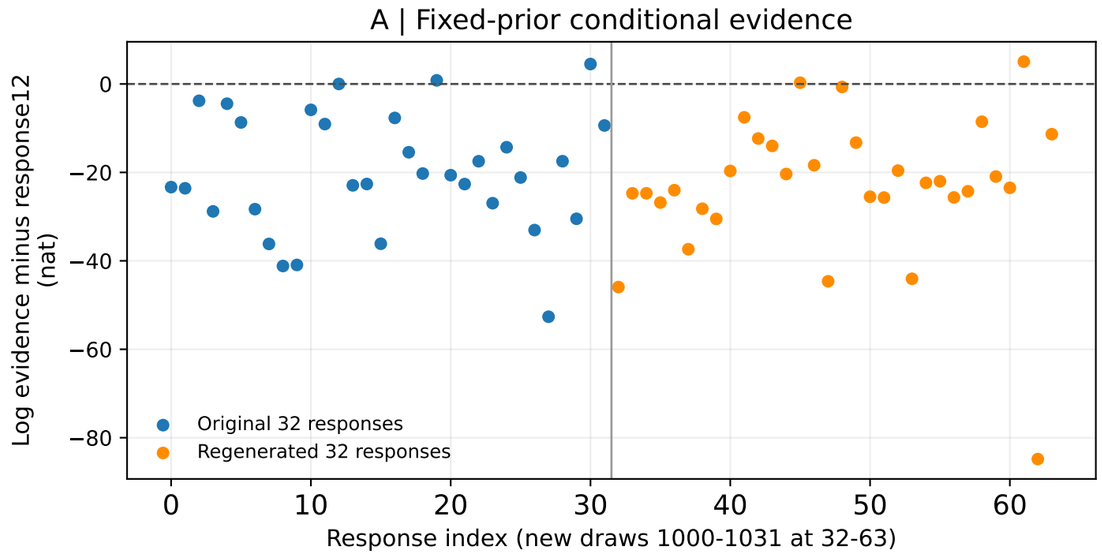
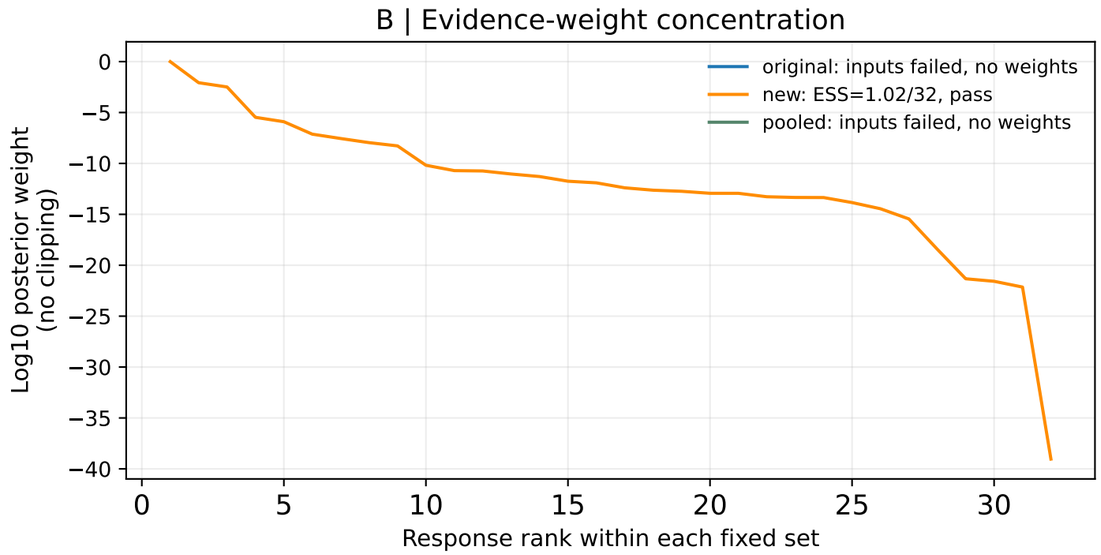
Regenerated response support on the same fixed-prior probes

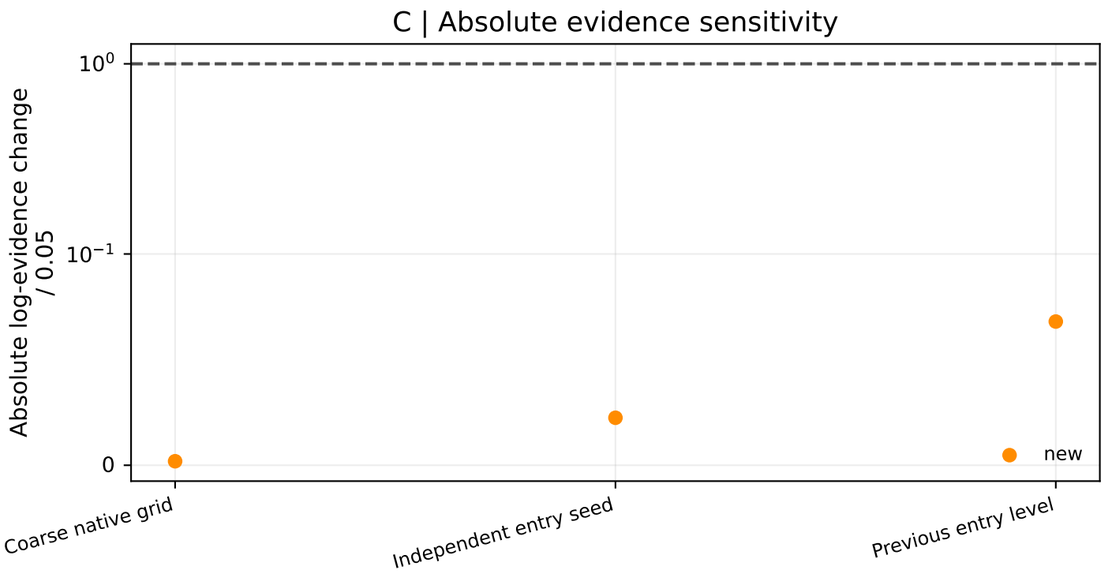
All 64 response states | same 128 native-PSF target objects | same nominal class / N(15, 5) prior

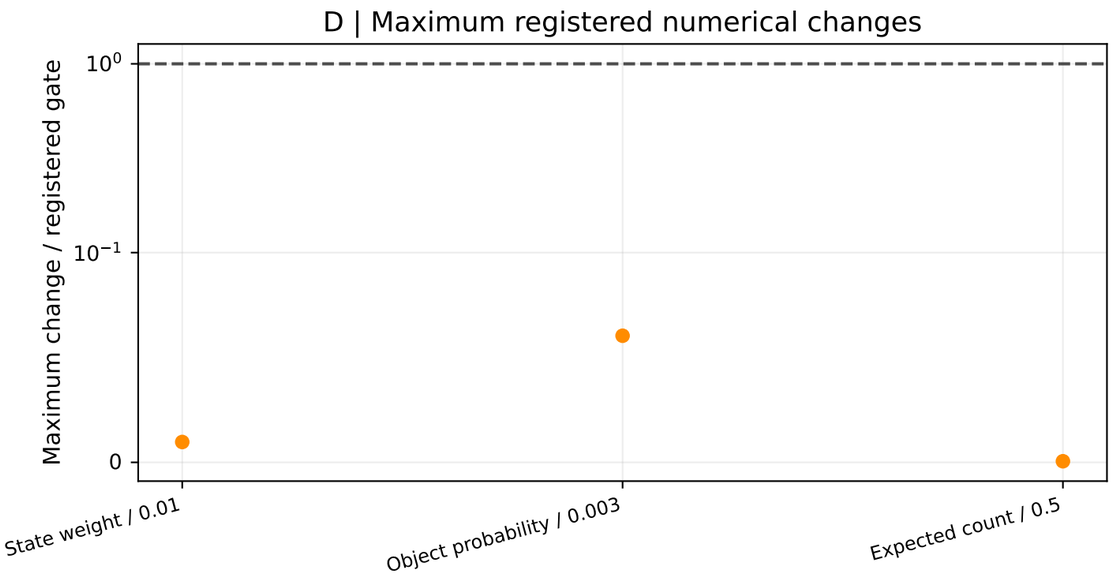
These are conditional probe evidences, not 26000-object population-marginal evidences or final-candidate response weights.

Original per-object flags: 35; unresolved flags: 1. All responses remain in the inventory.









A numerical pass does not establish response-library completeness. Regenerated draws still share the empirical teacher and model family.

Panels C-D retain failed gates; values at or above 1 fail their strict threshold. Failed input sets have no normalized weight curve.
