# Distance-mode responsibilities of the frozen main candidate

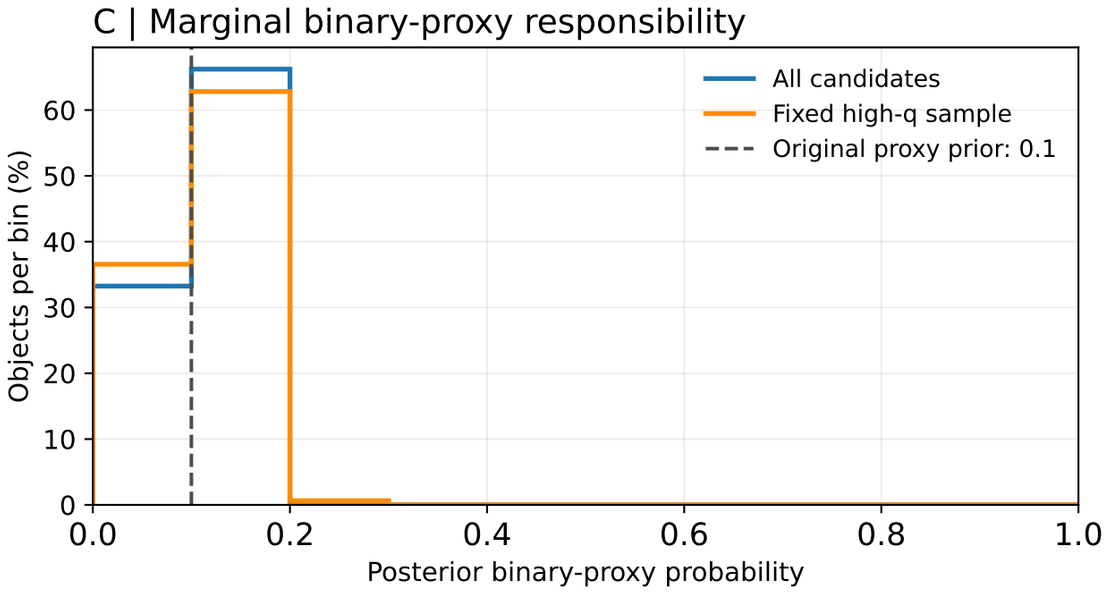

Response12 / calibration12 | 32 evidence-weighted correction states | each population draw normalized separately

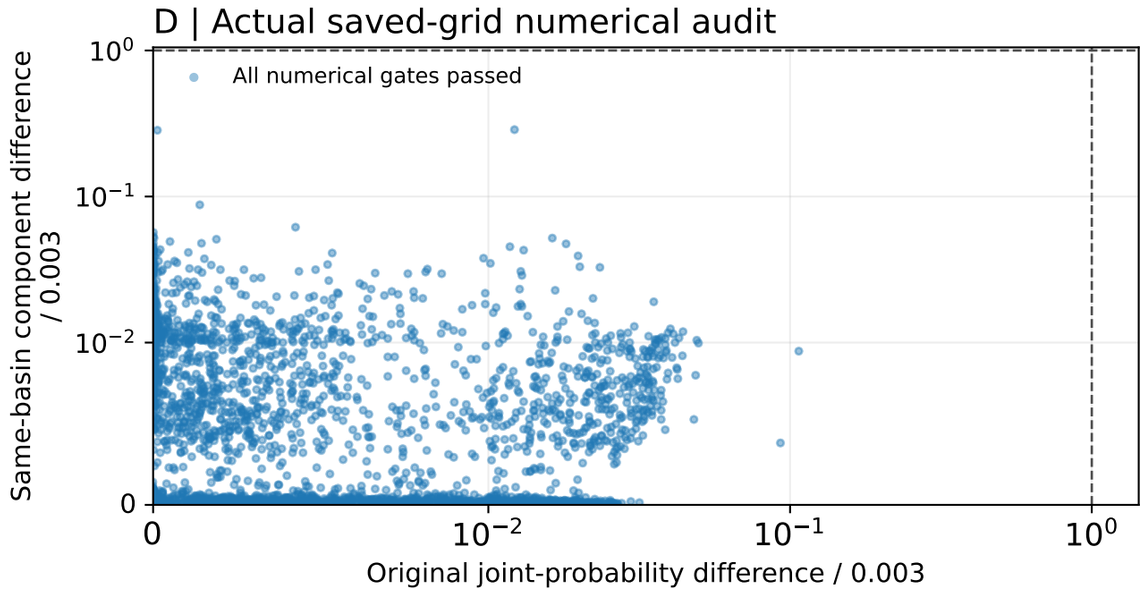

Inherited ensemble numerical acceptance: FAILED. Per-object mode audit failures: 0 / 3540.

All objects retained. High-q identities are fixed from the original candidate probabilities; q = P(distance < 10 kpc) > 0.95.

Panel B categories can overlap. Weak basins remain in saved products; small mass alone does not identify numerical artifacts.

Responsibilities describe this model: they do not confirm stellar classes, physical binaries or unique causes of multiple peaks.

Panel D uses symlog axes (linear below 0.01). Other acceptance gates include probability, quantile, mode-count and mass conservation.
