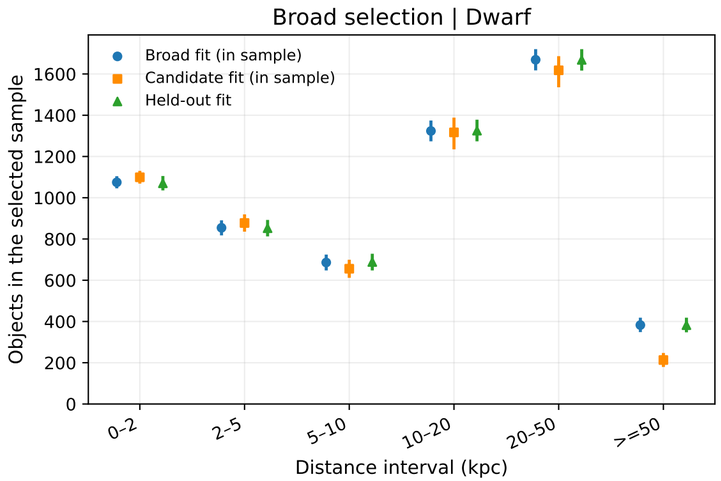
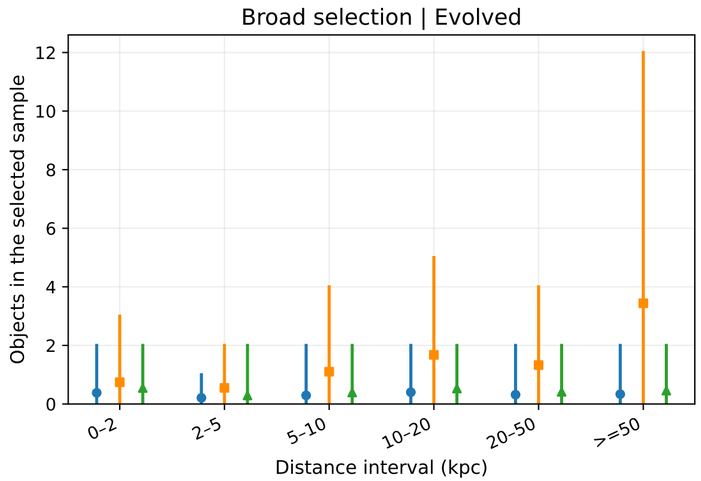
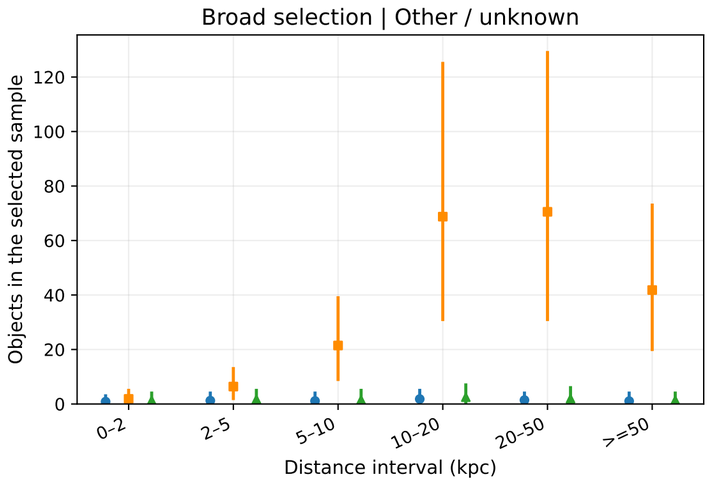
Fixed sky fields: shared class × distance count transfer

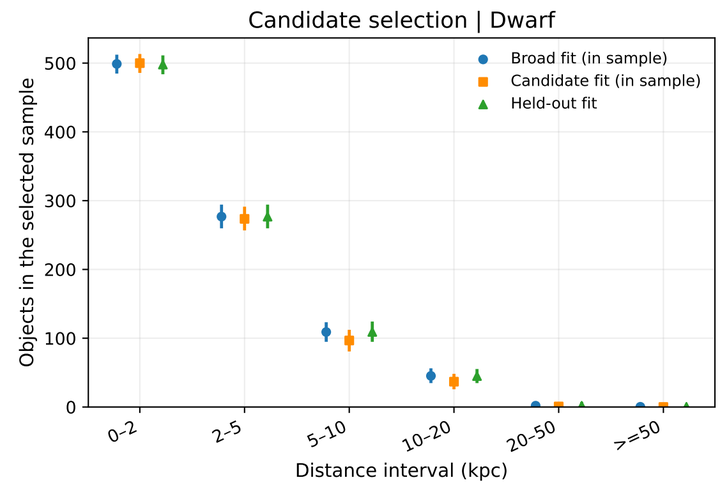
Fields 12 / 4 / 6 | broad n=6000, candidate n=935 | same native-PSF identities | main evidence-weighted view

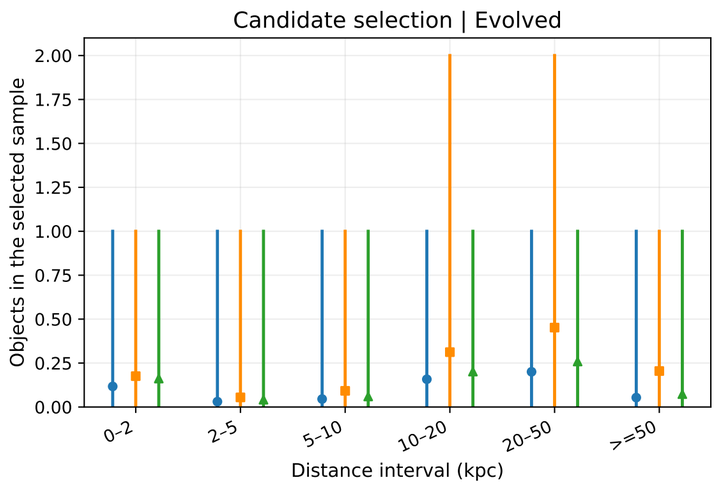
Points: model expected counts. Lines: shared realized-count 95% intervals. No true-distance counts supplied.

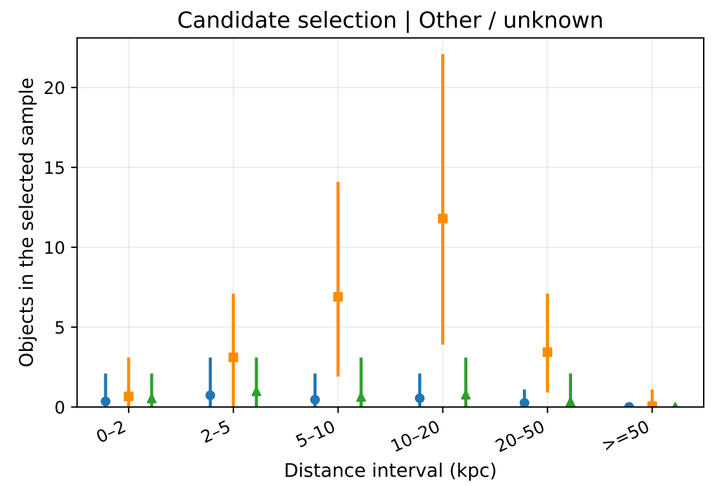












Only the held-out population fit excludes these fields. The broad and candidate fits include their photometry.

Unavailable conditional states are not renormalized. Inherited ensemble failures remain; counts are model-conditional.
