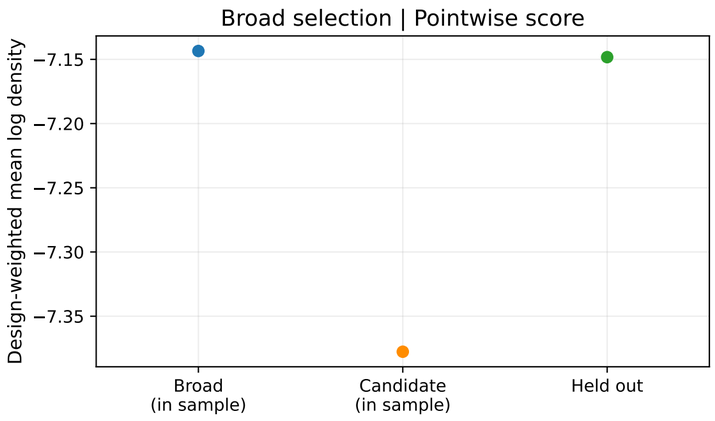
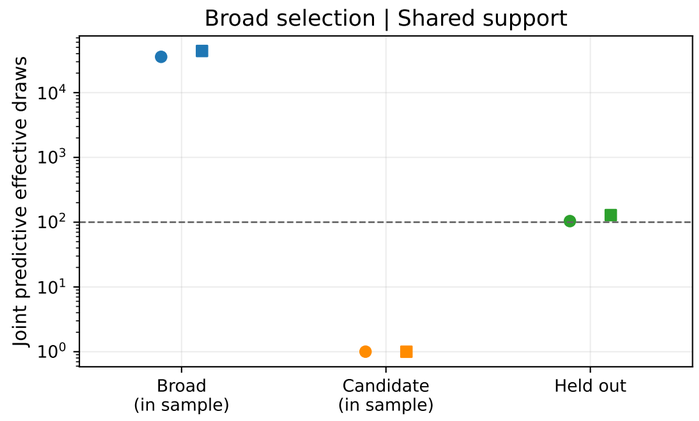
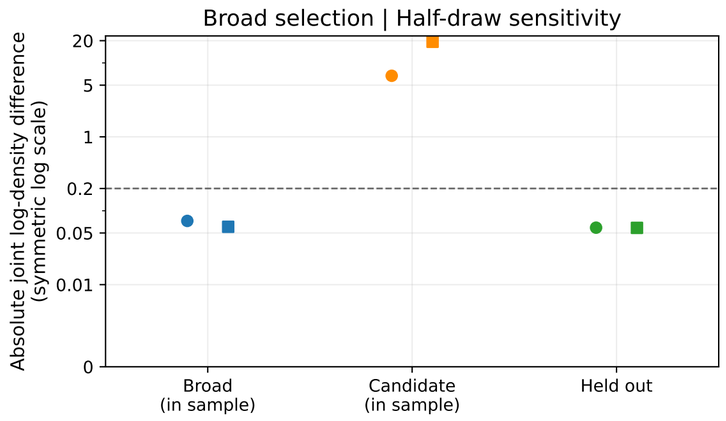
Photometric predictive support across frozen sky fields

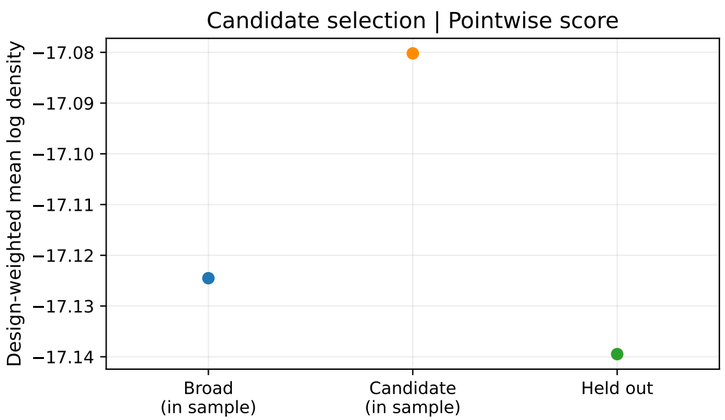
Main evidence-weighted view | broad n=6000, candidate n=935 | matching selection normalization | no distance references read

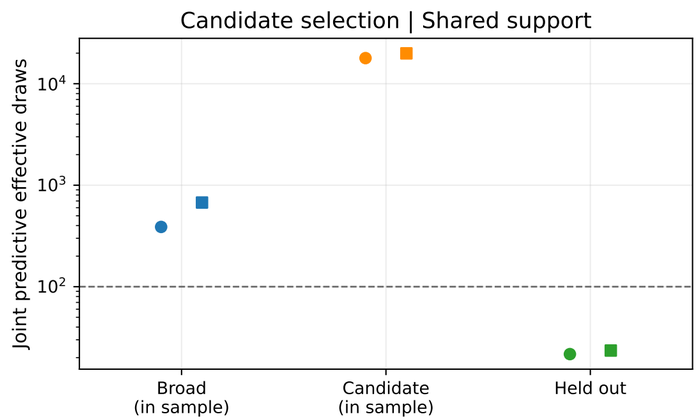
Circles: unit-object joint prediction. Squares: generalized design-weighted joint prediction (not a physical catalog density).

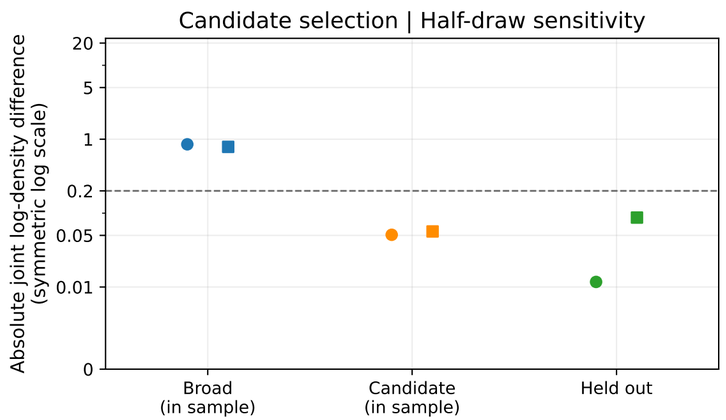












Broad selection — broad: available=True, conditional numeric=False; candidate: available=True, conditional numeric=False; holdout: available=True, conditional numeric=False

Candidate selection — broad: available=True, conditional numeric=False; candidate: available=True, conditional numeric=False; holdout: available=True, conditional numeric=False

Support requires effective draws ≥ 100 AND half log-density change < 0.2. Low support is retained, never flattened.

Photometric prediction does not establish true-distance accuracy, population recovery or independent contamination.
