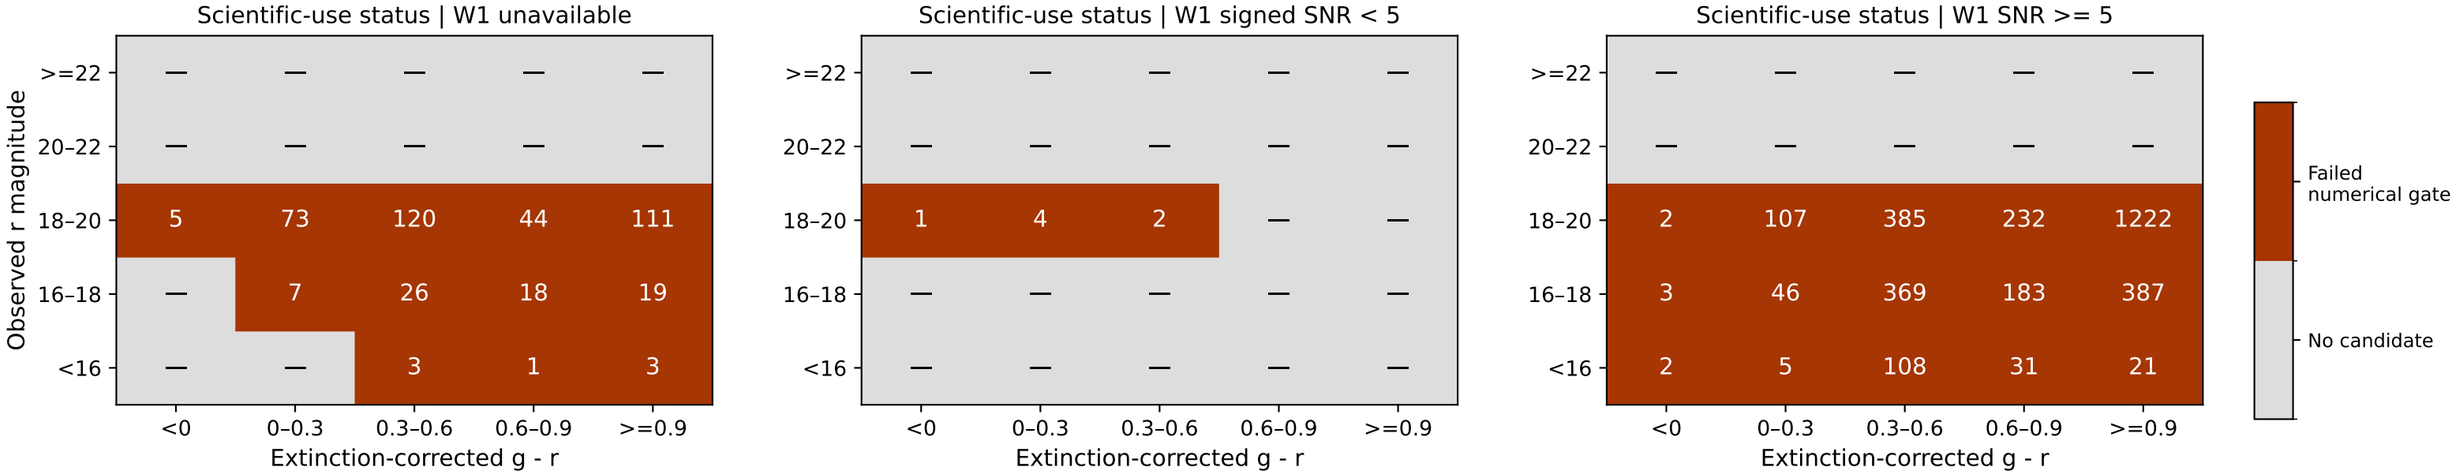
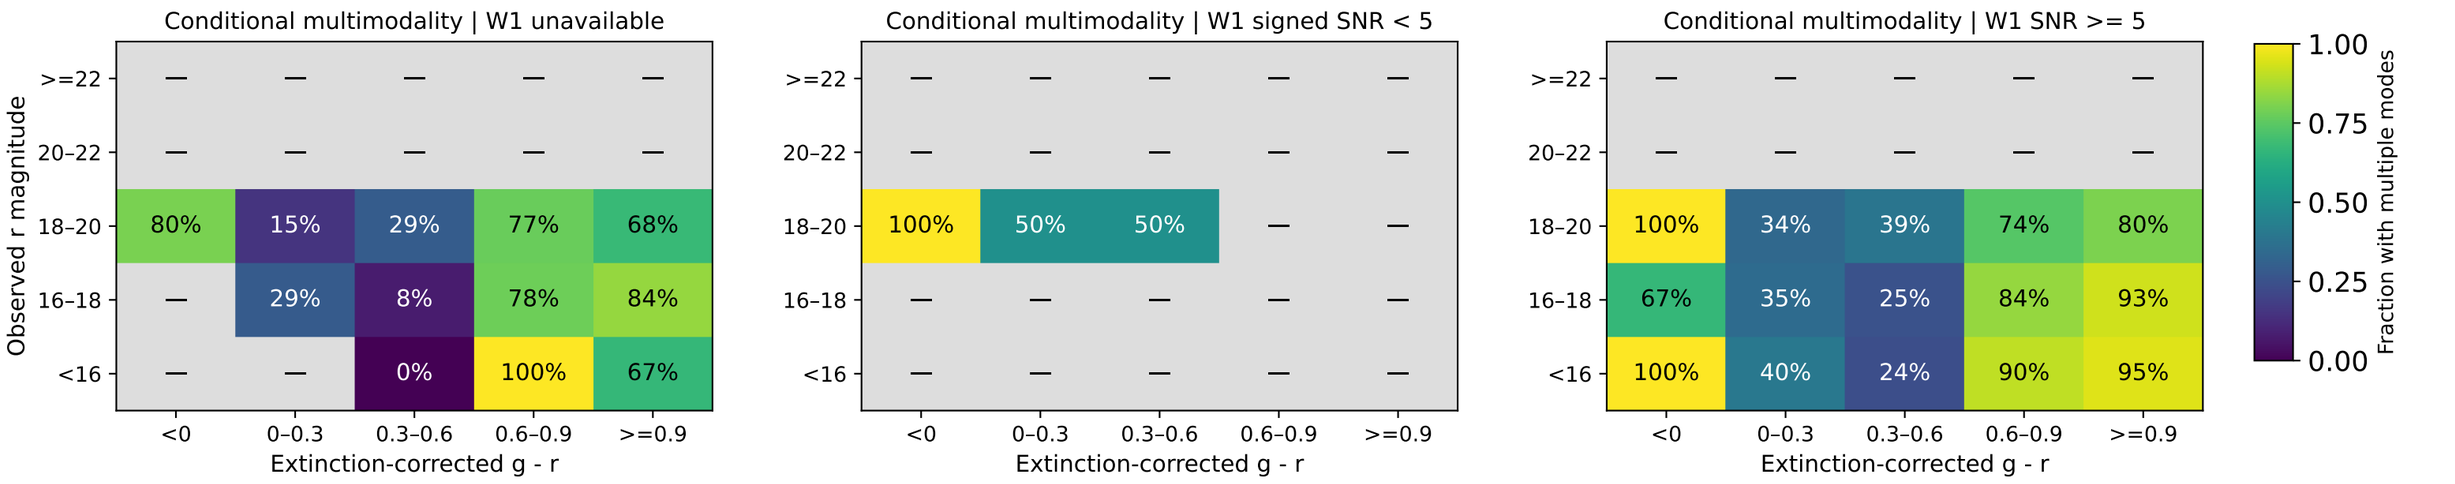
Final candidate: scientific-use disposition and retained ambiguity

Same 3540 native-PSF candidate identities | 30 occupied cells | no calibrated scientific-use domain established

Top: object counts; every occupied cell inherits the main ensemble evidence failure. Bottom: model-conditional information only.





Multiple modes means at least two distance basins with posterior mass > 0.05. All weaker modes remain in the full product.

Ambiguity does not erase numerical failure or establish physical classes / binaries. Full posteriors remain for conditional diagnostics.

Grey —: no candidate object. Precision/reference gaps, correlated external failures and global support limits remain in separate evidence tables.
