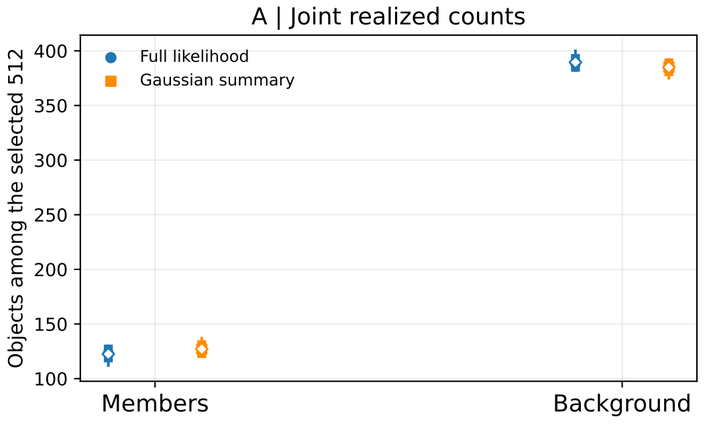
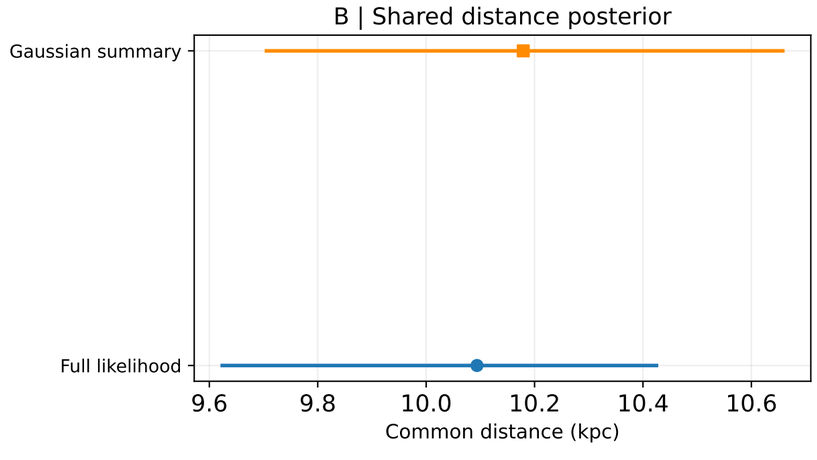
NGC288: full likelihood versus fair Gaussian summary

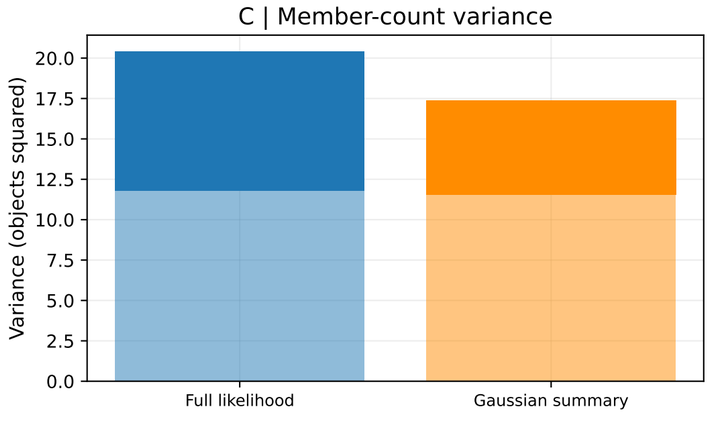
Same 512 photometric-first native-PSF objects | all 32 original shared response / calibration states

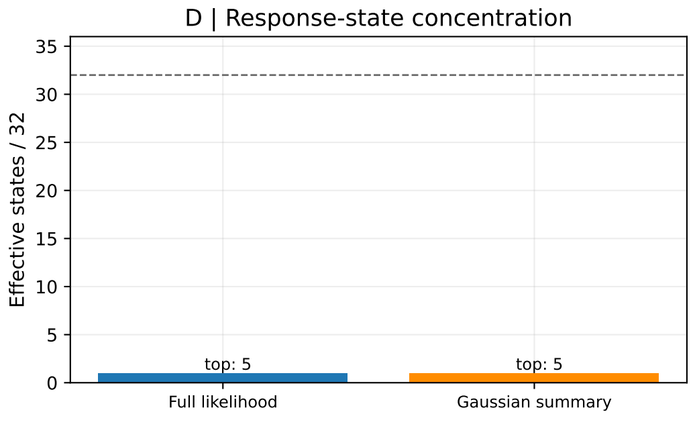
Full likelihood: numerical=False, sampling=True | Gaussian summary: numerical=False, sampling=True

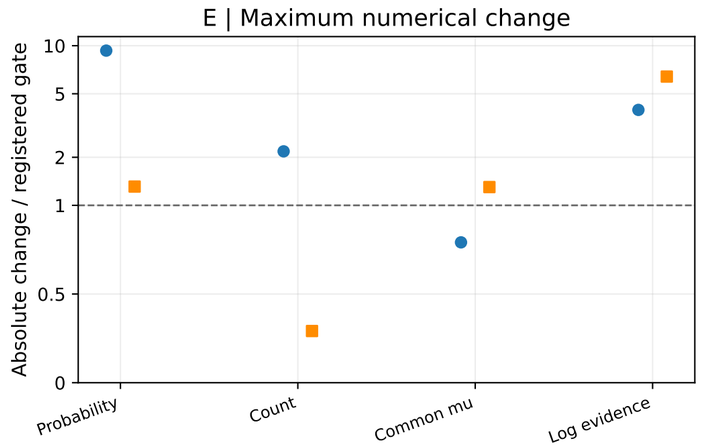
One supplied common-scale prior: 9.03 kpc, lower/upper scales 0.56/0.48 kpc. This is not independent scale recovery.

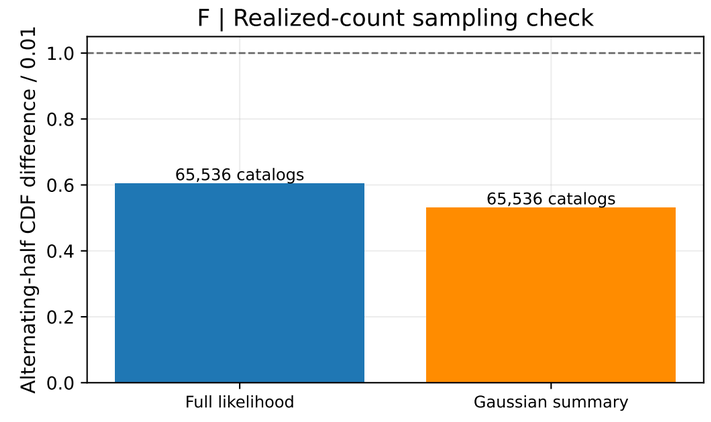












A: thin/thick bars = 95%/68% realized-count intervals; circles/squares = medians; open diamonds = means. B: median and 95% interval.

C: translucent = conditional variance; hatched = shared-state variance. E: final quadrature, native grid and entry alternatives; symlog scale.

F is one sampling diagnostic; all moment / variance / quantile gates remain in the report. Counts condition on this sample; no physical density.
