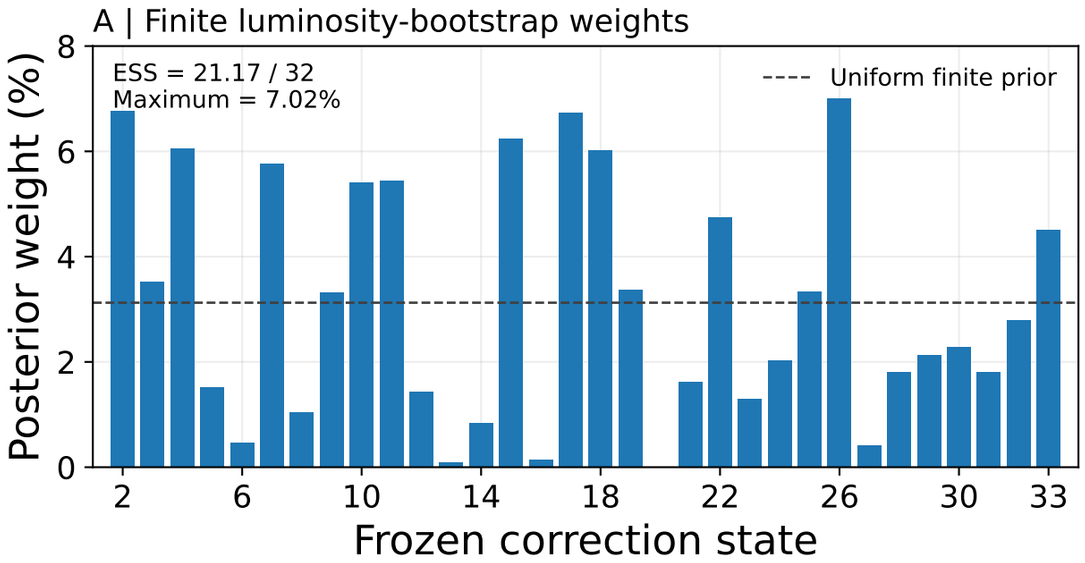
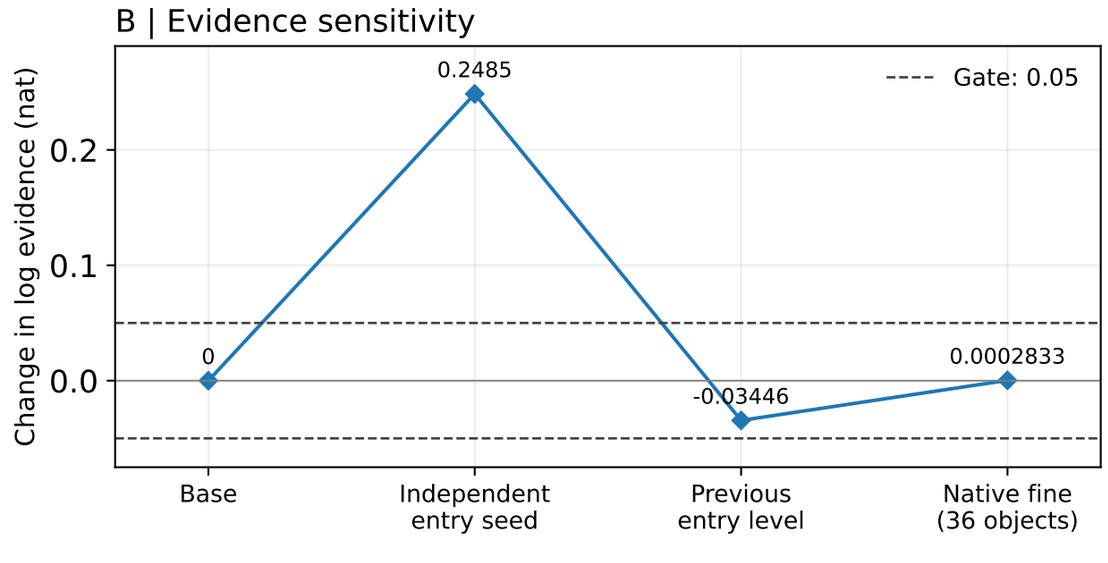
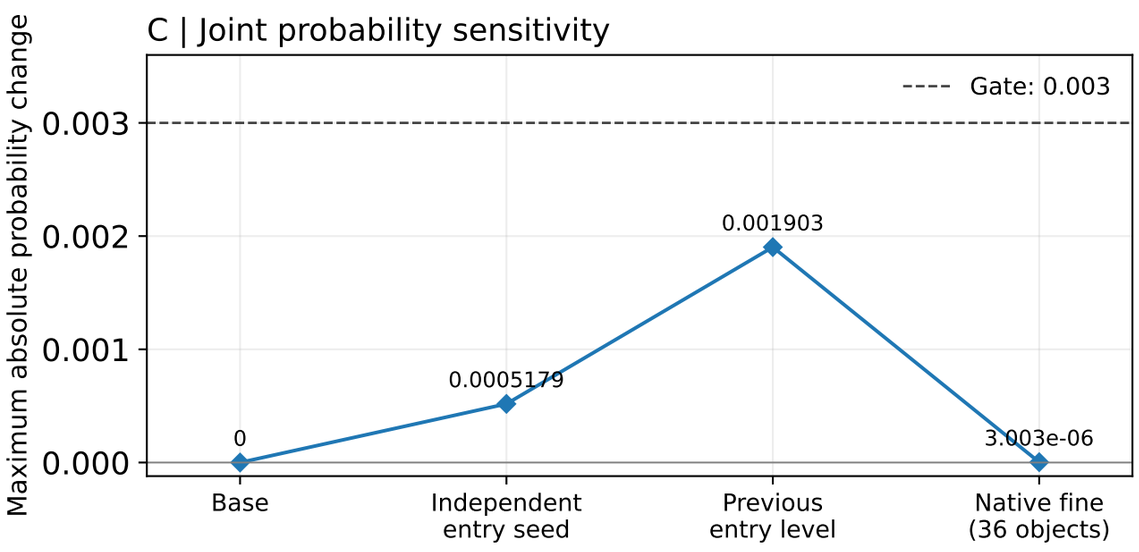
# Candidate calibration-state support and numerical sensitivity

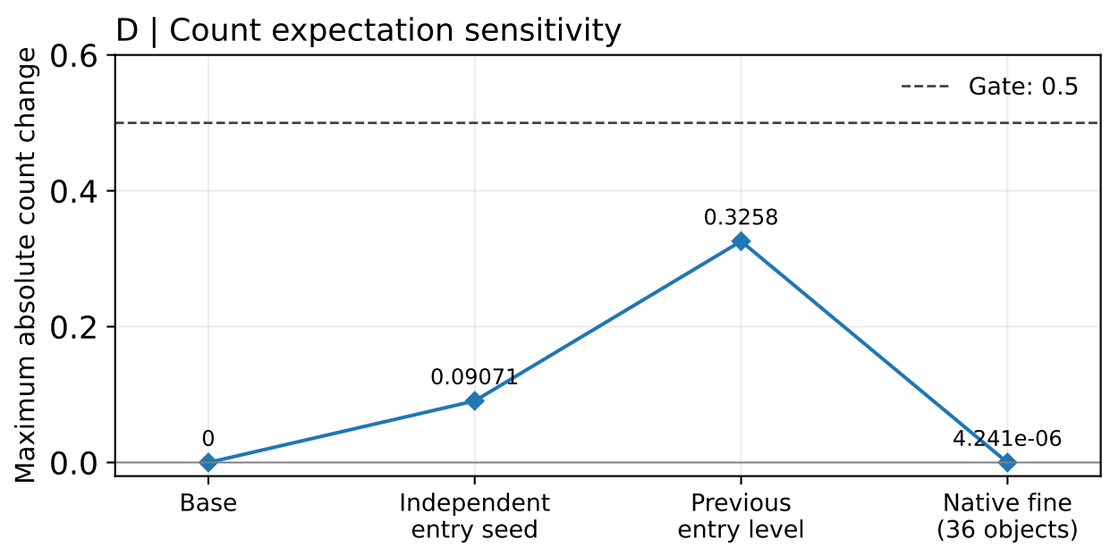
Main identity: 3540-object candidate cohort, response12 / calibration12, evidence-weighted luminosity bootstraps

Independent entry seed: evidence gate failed; probability, count and state-weight sensitivity gates passed.









Native fine transfer audits 36 / 3540 candidate objects. The original failure is retained; no acceptance threshold changed.

Finite luminosity-bootstrap support is not the independent 64-SED response experiment or an absolute calibration guarantee.
